1) Source code vs executable:

Source code is the code written by a programmer; an executable is the program ready to run.

2) Command to compile C:

gcc program.c -o program

3) What is a process?

A program that is currently running.

4) PID stands for:

Process ID (Process Identifier).

5) Check the last exit code:

Use echo $?

6) Meaning of return 0;:

It means the program ended successfully.

7) System call to create a new process: fork()

8) System call to replace the current process: exec()

9) See running processes:

Use the ps command.

10) Memory when a process ends:

The OS frees its memory.

11) Program before execution:

It is stored on disk.

12) Program during execution:

It is loaded into memory (RAM).

13) Why assign a PID?

To identify and manage each process.

14) When does a process end?

When it finishes its work or is terminated.

15) Who assigns the PID?

The operating system.
